- 6 Formalizing Inconsistencies
- 7 Measuring Inconsistencies
- 8 Conclusion

Technical Preliminaries: Content Security Policy (CSP)

Content Security Policy can significantly reduce the risk and impact of cross-site scripting attacks in modern browsers.

```
Content-Security-Policy: script-src 'self' https://apis.google.com
```

Technical Preliminaries: X-Frame-Options

- **Allow for Same Origin (Default Action)**

```
Header set X-Frame-Options: "SAMEORIGIN"
```

- **Allow from specific origin**

```
Header set X-Frame-Options: "ALLOW-FROM http://example.com/"  
Header set X-Frame-Options: "ALLOW-FROM http://www.example.com/"  
Header set X-Frame-Options: "ALLOW-FROM https://example.com/"  
Header set X-Frame-Options: "ALLOW-FROM https://www.example.com/"
```

- **Deny to everyone**

```
Header set X-Frame-Options: "DENY"
```

Technical Preliminaries: X-Frame-Options

The screenshot shows a web browser with the address bar at `w3schools.com/tags/tr...`. The page content displays "The iframe element" with a logo and a "Log in" button. The browser's developer tools are open, showing the HTML structure of the page. The HTML code is as follows:

```
<!DOCTYPE html>
<html>
<body>

<h1>The iframe element</h1>

<iframe src="https://www.w3schools.com"
title="W3Schools Free Online Web Tutorials">
</iframe>

</body>
</html>
```

The developer tools also show a console error: "Uncaught ReferenceError: what is not defined". The error message is: "what is not defined" at `HTMLIFrameElement.prototype.setAttribute`. The error is highlighted in the console.

Technical Preliminaries: Strict Transport Security

HTTP Strict Transport Security (HSTS) is a simple and widely supported standard to protect visitors by ensuring that their browsers always connect to a website over HTTPS

- 8 Conclusion

Motivation

- A web site may set the secure attribute on its session cookies when it is accessed using **Chrome**, but may forget the attribute when it is accessed using **Opera**.

Motivation

- A web site may set the secure attribute on its session cookies when it is accessed using **Chrome**, but may forget the attribute when it is accessed using **Opera**.
 - Opera users vulnerable to cookie

Motivation

- A web site may set the secure attribute on its session cookies when it is accessed using **Chrome**, but may forget the attribute when it is accessed using **Opera**.
 - Opera users vulnerable to cookie
 - May enable **session hijacking** attacks against a specific user population

Motivation

- A web site may set the secure attribute on its session cookies when it is accessed using **Chrome**, but may forget the attribute when it is accessed using **Opera**.
 - Opera users vulnerable to cookie
 - May enable **session hijacking** attacks against a specific user population
- A web site may configure its **content security policy (CSP)** differently when accessed from different countries.

Motivation

- A web site may set the secure attribute on its session cookies when it is accessed using **Chrome**, but may forget the attribute when it is accessed using **Opera**.
 - Opera users vulnerable to cookie
 - May enable **session hijacking** attacks against a specific user population
- A web site may configure its **content security policy (CSP)** differently when accessed from different countries.
 - e.g., due to the use of different ad networks, and there is no guarantee that all these CSPs enjoy the same security guarantees.

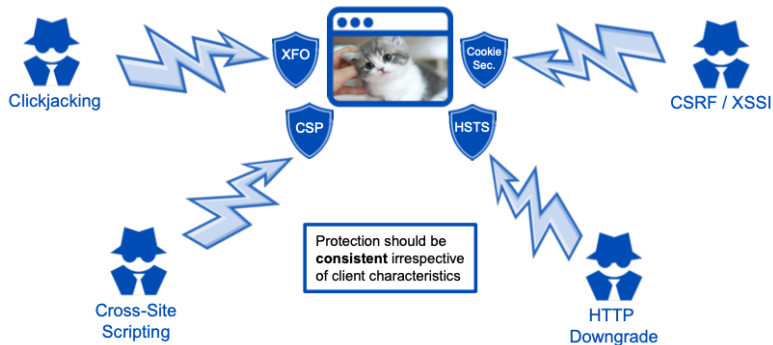

Motivation

- A web site may set the secure attribute on its session cookies when it is accessed using **Chrome**, but may forget the attribute when it is accessed using **Opera**.
 - Opera users vulnerable to cookie
 - May enable **session hijacking** attacks against a specific user population
- A web site may configure its **content security policy (CSP)** differently when accessed from different countries.
 - e.g., due to the use of different ad networks, and there is no guarantee that all these CSPs enjoy the same security guarantees.
- Security mechanisms might change when sites are accessed from different geolocations.

Motivation

- A web site may set the secure attribute on its session cookies when it is accessed using **Chrome**, but may forget the attribute when it is accessed using **Opera**.
 - Opera users vulnerable to cookie
 - May enable **session hijacking** attacks against a specific user population
- A web site may configure its **content security policy (CSP)** differently when accessed from different countries.
 - e.g., due to the use of different ad networks, and there is no guarantee that all these CSPs enjoy the same security guarantees.
- Security mechanisms might change when sites are accessed from different geolocations.
 - Visitor originates from a specific country or because they rely on a VPN or the Onion network to spoof their **geolocation**

Motivation

What is an Inconsistency?

Data Collection framework

They propose a data collection methodology to their analysis and they build a dataset of 13,626,145 responses collected from the 10,000 highest-ranking sites by crawling based on the Tranco list of January 1,

1	google.com	26	bing.com	55	sharepoint.com
2	gtld-servers.net	27	googletagmanager.com	56	wordpress.com
3	youtube.com	28	l-msedge.net	57	goo.gl
4	facebook.com	29	akadns.net	58	t-msedge.net
5	microsoft.com	30	fastly.net	59	googleusercontent.com

		42	nflxso.net	71	163.com
		43	doubleclick.net	72	mozilla.org

Data Collection framework

They identify three factors which users may legitimately manipulate as part of their everyday Web browsing experience, without realizing that they can unintendedly affect Web application security.

Factor	Set of tests	Tests
User-Agent	Windows client Linux client macOS client Android client iOS client	User-Agent header: Chrome 96, Firefox 95, Edge 96, Opera 82 User-Agent header: Chrome 96, Firefox 95, Opera 82 User-Agent header: Chrome 96, Firefox 95, Edge 96, Opera 82, Safari 15.2 User-Agent header: Chrome 96, Firefox 95, Opera 96 User-Agent header: Chrome 96, Firefox 95, Edge 86, Safari 15.2
Vantage Point	VPN service Onion network	Servers from hidemyass.com - 1 per country (218 countries) Standard Onion client - 1 end-node per country (49 countries)
Client Configuration	Language	Accept-Language header: en, es, cn, ru, de

Table 1: Selected client conditions that might influence the received security headers

Table of Contents

- 1 Introduction
- 2 Technical Preliminaries
- 3 Motivation
- 4 Contribution
- 5 Data Collection framework
- 6 Formalizing Inconsistencies**
- 7 Measuring Inconsistencies
- 8 Conclusion

Formalizing Inconsistencies

Authors introduce general definitions of consistency for clientside security mechanisms and they express them to a set of popular defenses available in modern browsers.

- All the responses collected from the **same URL must enforce the same security policies.**

Formalizing Inconsistencies

Authors introduce general definitions of consistency for clientside security mechanisms and they express them to a set of popular defenses available in modern browsers.

- All the responses collected from the **same URL must enforce the same security policies**.
 - But they consider, two security policies can be syntactically different, yet provide an equivalent level of protection. For example, two syntactically different CSPs may both effectively mitigate the dangers of XSS.

Formalizing Inconsistencies

Authors introduce general definitions of consistency for clientside security mechanisms and they express them to a set of popular defenses available in modern browsers.

- All the responses collected from the **same URL must enforce the same security policies**.
 - But they consider, two security policies can be syntactically different, yet provide an equivalent level of protection. For example, two syntactically different CSPs may both effectively mitigate the dangers of XSS.
- **Intra-test consistency**: It requires all compatible responses collected within the same test to provide an equivalent level of protection.

Formalizing Inconsistencies

Authors introduce general definitions of consistency for clientside security mechanisms and they express them to a set of popular defenses available in modern browsers.

- All the responses collected from the **same URL must enforce the same security policies**.
 - But they consider, two security policies can be syntactically different, yet provide an equivalent level of protection. For example, two syntactically different CSPs may both effectively mitigate the dangers of XSS.
- **Intra-test consistency**: It requires all compatible responses collected within the same test to provide an equivalent level of protection.
- **Inter-test consistency**: It requires all compatible responses collected within two different tests (defined for the same factor) to provide an equivalent level of protection.

Example of consistencies

Consider just two tests for the User-Agent factor: Chrome 96 for Windows and Firefox 95 for Linux. Assume that pages are visited five times for each test and may be classified in two security levels: low (L) and high (H)

Chrome 96	Firefox 95
<i>H, H, H, H, H</i>	<i>H, H, H, H, H</i>
<i>H, H, H, L, H</i>	<i>H, H, H, H, H</i>
<i>H, H, H, H, H</i>	<i>L, L, L, L, L</i>

Table 2: Example observations upon crawling

- First row represents a scenario where Intra-test consistency and inter-test consistency are satisfy.
- Second row represents a scenario where intra-test consistency doesnot hold, hence inter-test consistency is undefined.
- Third row represents a scenario where intra-test consistency is satisfied but inter-test consistency is not.

- 8 Conclusion

Measuring Inconsistencies

Authors apply their definitions to the collected data and they report on the key findings. Their measurement shows that a significant fraction of the analyzed Web sites suffers from different types of client-side security inconsistencies.

Mechanism	Usage	# Sites w/ intra-test inconsistencies					# Sites w/ inter-test inconsistencies					# Sites w/ only inter-test inconsistencies				
		UA	Lang.	VPN	Tor	Any	UA	Lang.	VPN	Tor	Any	UA	Lang.	VPN	Tor	Any

Table 6: Overview of overlap with additional snapshots of our analysis

Disclosure Email

Authors sent email to the respective site operator, contained information about their institutions, as well as a detailed description of the individual inconsistent headers and how they were collected.

Hello,

We are a team of security researchers from the CISPA Helmholtz
→ Center for Information Security located in Saarland, Germany
→ and Università Ca' Foscari Venezia, Italy. In our current
→ research project, we investigate inconsistent behavior in the
→ deployment of security headers for Web applications.

For that, we have visited your site through different vantage
→ points (VPN and Tor) as well as with different configurations
→ (User-Agents and Accept-Language request headers).

In our automated tests, we detected both non-deterministic
→ differences (e.g., we received different levels of security
→ even with the same user agent) or those differences which
→ seemed related to the vantage point or configuration.

We would like to raise your attention to one of those
→ inconsistencies that occurred on <DOMAIN>:
<DETAILS_ABOUT_INCONSISTENCY>

We would appreciate if you can check the reason for the issue,
→ address it to ensure consistent security, and also let us know
→ about what such a reason might have been, since this will allow
→ us to better help others in the future.

If you have any questions or need further information, please do
→ not hesitate to contact us by answering this email.

- In total, they sent out 256 emails.
- They only got 21 response
- Seven operators asked them to provide more details

- 7 Measuring Inconsistencies
- 8 Conclusion**

Conclusion

- This paper investigated the inconsistent configuration of client-side security mechanisms on top sites.
- Client-side security is not equally delivered to all clients!
 - 321 Sites had some security inconsistencies!
- Authors observed that Inter-test inconsistencies across network access methods might arise due to misconfigured origin server for specific geolocations.

Thank You!
